

Local structural states and observation constraints

Ordered local exon structures on shared genomic material

A Exon configuration C

$[a\ b] \leftrightarrow [a]—[b]$
Ordered exon intervals

B Local repertoire R

$R = \{C_1, C_2\}$ on m

AND coexisting structures
Distinct members

OR complete alternatives
Observation sets a lower bound
additional members may occur

C Tip compatibility

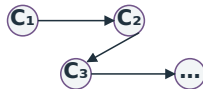

Allowed states

Fully unknown $\rightarrow$ all weights 1
Known DNA presence retained

D Candidate exon boundaries
observed + supported candidates

admissible closure
reachable states

Finite state space
Conditional on catalogue
